

FEB Composites

Quick start. Five minutes, and you're in.

The composites app is where the team keeps track of everything we build: parts, molds, the runs that make them, what's on the shelf, and who signed what. You don't need to learn all of it. Most people use three things: the **Dashboard**, a **Work Order**, and the **buy-off button**. This sheet covers those.

Relax. You can't break anything by looking around. Clicking a tab, opening a record, or scrolling changes nothing. Edits only happen when you press **Edit** or a buy-off button, and a lead can fix anything that goes wrong.

1 Get in

1. Open feb-composites.web.app on your laptop or phone.
2. Press **New here? Create account**.
3. Type your real name (it goes on everything you sign), pick a username and a password.
4. That's it. You're a member and can start working straight away.

Just curious? **View as guest** shows the whole app read-only, no account needed.

On your phone. In the browser's share menu, choose *Add to Home Screen*. The app then opens like any other app, which is handy at RFS.

The screenshot shows the FEB Composites login interface. At the top is the logo and the text 'Team database. Sign in with your team account.' Below this are two input fields: 'USERNAME OR EMAIL' and 'PASSWORD'. There are three buttons: 'Sign in' (dark blue), 'New here? Create account' (light blue), and 'Forgot password' (light blue). At the bottom, there is a 'View as guest' button. A note at the very bottom states: 'See the whole app. You won't be able to change anything — every buy-off carries a name.'

2 Find your way around

The blue sidebar on the left is every section of the app. You'll live in the first few; the rest are there when you need them.

	Dashboard	What needs doing, today. Start here.
	Season	Every part we plan to make this year.
	Parts	One part: its mold, its layup stack, its runs.
	Work Orders	One run at making a part, step by step.
	Molds	Molds, stack plans and tooling board.
	Inventory	What we have and where it lives.
	R&D	Test panels, coupons and trials.
	Schedule	The season by station, or the week by person.
	Budget	Purchases, arrivals and reimbursement.
	Documents	Datasheets, standards and printables.
	Reports	Exports, print boards and labels.
	People	The roster, and who's working on what.

Along the top of every page:

Scan a QR label on a mold, board or bin to jump straight to it.

Search anything: a part, a work order, a person. Shortcut: `Cmd K` (or `Ctrl K`).

Notifications, for when somebody @mentions you or assigns you something.

Light or dark mode. Your pick is remembered.

Getting lost is fine. Everything is linked. Click any blue name to jump to that record, and the **Back** button takes you back the way you came.

3 Start every session on the Dashboard

The Dashboard answers “what should I do now?” in four columns. Each big number counts what’s under it.

Stopped A run that’s stuck. Someone needs to unblock it before work continues.

Waiting on you **Your to-do list.** Steps you can sign right now, and purchases waiting on your OK.

Due this week Deadlines in the next seven days, late ones first.

On the clock Cures running now, the next milestone, and days until competition.

Rule of thumb. If “Waiting on you” is empty, check the week’s plan on ≡ **Schedule** or ask in #composites what needs a hand.

4 Sign off a step (a “buy-off”)

A **work order** is the traveler for one layup: the steps, the ply stack, the materials, the photos. When you finish a step at the table, you sign it in the app. That’s a buy-off, and it records your name and the time.

1. Open the work order (from the Dashboard, a search, or by scanning its label).
2. The **gold dot** is the step to do now. Done steps show a ✓ and who signed them.
3. Do the step for real, then press **buy off as your name**.
4. If something is missing (a photo, a note, a linked CAD file) the app tells you what and gives you a button to add it. Nothing is lost by trying.

🕒 **Cure hold.** A clock on a step means the resin is still curing. The app won’t let anyone sign until it’s done. “why 48 h?” explains where the number came from.

⚠ **Something went wrong?** Press the flag next to a step (or **Raise an issue**) and write what happened. That’s what issues are for, and nobody gets in trouble for one.

Cheat sheet

⌘ K search everything

✎ **Edit** change a record, then it saves as you go

🔔 someone @mentioned you

Click your avatar (top right) to set your photo

+ **New WO** start a work order

🖨 **Print** a paper traveler for the table

⚠ raise an issue on a step

People tab: change the name on your buy-offs

5 At the shop, on your phone

The app works the same on a phone. The sidebar folds away behind , and the account buttons move under .

Scanning labels. Molds, boards and storage bins carry printed QR labels.

- **Signed in:** tap  and point your camera at the label. The record opens.
- **Any phone camera:** scanning a label opens a public page with the part name, stage and location, even without an account or good signal.

Photos. Tap  next to a step to attach a picture of your layup. It's never required, but it's the easiest way to show what you did.

Weak wifi at RFS. The loading screen shows five lights. If one goes amber it tells you what's stuck; **Continue anyway** still gets you in.

Stuck? Ask in **#composites** on Slack or grab a lead at the Monday meeting. Nobody expects you to know the app on day one. The full manual lives in the repo at 06 Composites App/app/README.md if you ever want the deep version.

Screenshots show sample data from app v6.1.0. Your screen will have the team's real parts and names.
